Homework 5

1. Draw the memory layout for the word-sized (all elements are 4 byte wide) list, pixel = { 0x1000, 0x03, 0x56DD23FF }. The base address is 0x1FC0. [10]

2. Use minimum number of MIPS instructions (add, sub : see page 64 of textbook) and write the assembly code for the below Java/Python code expression. Assume all the variables are 32-bit data. You may choose any registers to hold the variable contents. [10 points] $x1 = (r + (t + r)) - y + 5$; $y = x1 + y$

2. MIPS code for

$x1 = (r + (t + r)) - y + 5$
 $y = x1 + y$

Assume the variables are in the following registers:
 $x1 \rightarrow \$S0$ $t \rightarrow \$S2$
 $r \rightarrow \$S1$ $y \rightarrow \$S3$

add \$S2, \$S2, \$S1 # $(t+r) \rightarrow \$S2$
add \$S1, \$S1, \$S2 # $(r+(t+r)) \rightarrow \$S1$
sub \$S1, \$S1, \$S3 # $((r+(t+r))-y) \rightarrow \$S1$
addi \$S0, \$S1, 5 # $((r+(t+r))-y)+5 \rightarrow \$S0$
add \$S3, \$S0, \$S3 # $(x1+y) \rightarrow \$S3$

3. Translate the Python code, $A[5] = A[4] * 4 + B[3]$, into MIPS assembly code. You may assume any register for base addresses and variables. [15 points]

3 translate to mips
 $A[5] = A[4] * 4 + B[3]$

Assume A base address in \$S0
Assume B base address in \$t0
Assume A + B are word sized lists (4 byte)

\downarrow offset \downarrow base address

lw \$S1, 16(\$S0) # load A[4] into \$S1 offset = $4 \times 4 = 16$
lw \$t1, 12(\$t0) # load B[3] into \$t1 offset = $3 \times 4 = 12$
sll \$S1, \$S1, 2 # $A[4] \times 4 = A[4] \times 2^2 \rightarrow \$S1$
add \$S2, \$S1, \$t1 # $((A[4] \times 4) + B[3]) \rightarrow \$S2$
sw \$S2, 20(\$S0) # store \$S2 in A[5] offset = $5 \times 4 = 20$
